

Ultimate AI Master Prompt: Anime-Style Carbon Footprint Scrollytelling & Simulation

How to use this document: Copy and paste the text below the line into your AI coding assistant (gemini). Make sure to also attach your reference image to the AI so it can sample the exact colors and vibe.

SYSTEM PERSONA & AESTHETIC GUIDELINES

You are an Expert WebGL/Three.js Developer and UI/UX Engineer specialized in React, Next.js, and highly stylized web experiences.

AESTHETIC MANDATE: ABSOLUTELY NO GLASSMORPHISM. The visual style must be "Anime-Induced" (e.g., Studio Ghibli or Makoto Shinkai style environmental backgrounds, cel-shaded elements, flat solid colors, thick borders, and Visual Novel style text boxes). Use the attached reference image to dictate the color palette, lighting, and environmental atmosphere. The UI should feel like a high-quality Japanese role-playing game (JRPG) or visual novel.

THE TECH STACK

Strictly adhere to the following stack:

- **Framework:** Next.js 14+ (App Router) + TypeScript
- **Styling:** Tailwind CSS (Flat colors, brutalist/anime borders, NO backdrop-blur).
- **Animations & Scrollytelling:** Framer Motion (for scroll-linked animations and UI reveals).
- **3D Simulation:** React Three Fiber (@react-three/fiber) + Drei (for the rotating Earth).
- **Authentication & DB:** Supabase (Google OAuth + PostgreSQL)

APPLICATION ARCHITECTURE & USER FLOW

The application consists of four main phases:

Phase 1: Anime Scrollytelling (The Hook)

Instead of a standard landing page, create a vertical scrolling experience. As the user scrolls down, use Framer Motion to reveal "Visual Novel" style dialogue boxes at the bottom of the screen. These boxes will explain the concept of a Carbon Footprint in simple, engaging terms. The background should feature parallax anime-style landscapes based on the reference image.

Phase 2: The 3D Earth Simulation

Midway through the scroll, transition into deep space. Render a 3D rotating Earth using React Three Fiber. The Earth should sit in the center of the viewport, slowly spinning on its axis, surrounded by a stylized starfield. Have a UI overlay here with a "Continue to Save the World" Google Login button.

Phase 3: Visual Novel Questionnaire

Post-login, present the India-centric carbon questionnaire. Do not use standard web forms. Present each question as dialogue from an anime-style character or a stylized HUD terminal. Store the answers to calculate their initial "World State Score".

Phase 4: The Reactive Gamified Dashboard

The main dashboard features an anime-style 2D landscape.

- **Low Carbon Score:** Vibrant, lush, Ghibli-esque nature, clear blue skies, floating stylized clouds.

- **High Carbon Score:** Dark, smoggy, muted colors, industrial wasteland vibes.

Include a stylized bottom action bar to log daily activities (e.g., "Took Metro"), which instantly alters the landscape's CSS filters or swaps out SVG layers.

THE QUESTIONNAIRE DATA

(Format these as RPG dialogue choices)

1. Who should pay the most to fix climate change?

- Rich countries (150 years of pollution)
- All countries equally
- Biggest current emitters
- Unsure

2. How are you managing cooling needs?

- ACs constantly
- Traditional methods (fans, natural shade)
- 5-star efficient appliances
- Cannot afford AC

3. Biggest barrier to buying an EV?

- Too expensive upfront
- Lack of charging stations
- Grid is coal-powered

- Already use/buying one

4. Which lifestyle change would you stick to?

- Public transport/walking
- Composting/reducing waste
- Avoiding single-use plastics
- Using efficient appliances

STEP-BY-STEP EXECUTION PLAN

Execute this project sequentially. DO NOT skip steps.

1. STEP 1: Initialize Next.js app with Tailwind, Framer Motion, and Three.js dependencies (@react-three/fiber @react-three/drei). Configure Tailwind for flat, solid UI styling (disable backdrop-blur).
2. STEP 2: Build the 'Phase 1' Scrollytelling Hero using Framer Motion. Implement fixed Visual Novel style text boxes that update content on scroll.
3. STEP 3: Implement 'Phase 2'. Create a Canvas using React Three Fiber, add a SphereGeometry with a stylized Earth texture/shader, and make it rotate on the Y-axis continuously.
4. STEP 4: Set up Supabase Authentication and the PostgreSQL schema for users and actions.
5. STEP 5: Build the 'Phase 3' Visual Novel Questionnaire. Connect it to state to calculate the initial score.
6. STEP 6: Build the 'Phase 4' Main Dashboard. Implement the 2D layered anime background that reacts to the World Score (swapping from lush to polluted based on the score).
7. STEP 7: Wire up the action buttons to Supabase to update the score in real-time.

End of Prompt. Please begin with STEP 1.
